Figure 1: Evolution of the dark matter relic density parameter $\Omega_c h^2$. The figure consists of 10 panels (1-10) and a summary plot at the bottom. The panels show the relic density $\Omega_c h^2$ as a function of the dark matter mass m_χ (GeV) for various annihilation channels. The relic density decreases as the dark matter mass increases, and the final relic density is approximately 0.03 for $m_\chi = 100$ GeV.
